anti-HHV-6

ELISA-VIDITEST

anti-HHV-6 IgG

anti-HHV-6 IgM

- Diagnostics of sixth disease (exanthema subitum)
- Differential diagnostics of acute fever in small children (exanthema, respiratory infection, gastroenteritis, neuroinfection, hepatitis)
- Differential diagnostics of lymphadenopathy and infectious mononucleosis
- Differential diagnostics of opportunistic infections in immunodeficient patients
Why using ELISA-VIDITEST anti-HHV-6:

- High sensitivity and specificity according to diagnostic evaluation studies
- Quantitative IgG (AU/mL) and qualitative IgM evaluation
- IgG determination in serum and cerebrospinal fluid
- Intrathecal synthesis calculation using VIDITAB software or the formula mentioned in the ELISA-VIDITEST anti-HHV-6 IgG (CSF) Instruction manual
- Unified incubation times for IgG and IgM determination
- Ready-to-use controls and HRP conjugate
- Incubation at laboratory temperature

HHV-6 IgG status was characterised by 2 CE IVD ELISA kits for the detection of anti-HHV-6 IgG antibodies. HHV-6 IgM status was characterised by CE IVD ELISA and IFA kits for the detection of anti-HHV-6 IgM antibodies. Equivocal samples were excluded from the studies.
